Dear Hiring Manager,

I am seeking a Python backend or automation role where I can contribute practical experience in real-time integrations, reliable transaction workflows, and systems troubleshooting. Through independent projects, I have built services in Python and Rust and a TypeScript trading workspace. I enjoy turning difficult failure cases into clear, testable behavior.

Talon is my strongest example of backend engineering. I separated Rust event workers from Python account actors and a dedicated SQLite state service, using bounded queues, independent writer lanes, and explicit reconciliation for uncertain transaction outcomes. Its August 2026 release record includes 393 Python and 41 Rust tests alongside static checks and deployment documentation. This work taught me to treat recovery, observability, and operational controls as part of the design.

With VolaPilot, I brought that approach into a product built with TypeScript, React, Cloudflare Workers/D1, and the Deriv API. The workspace connects streaming market data, analysis, execution controls, practice, and trade review. My work includes encrypted sessions, shared execution controls, and recovery after interrupted requests. A local benchmark of selected-rule calculations showed 2.20 times faster Over refreshes and 3.01 times faster Under refreshes while preserving the compared continuous-feed results.

My Diploma in Telecommunications Engineering and internships/attachments at KBC, KCAA, and Heaven Bound TV add a practical foundation in fault-finding across broadcast systems, aviation communications, and IT networks. I bring that same curiosity to software: understand the system, reproduce the issue, make a measured change, and document what the evidence supports.

I am based in Nairobi and open to full-time or contract opportunities, including remote work and Nairobi hybrid/on-site roles. My portfolio includes architecture case studies, technology choices, and validation context. I would welcome an interview to walk through these systems, discuss their trade-offs, and demonstrate how I could contribute to your team.

Kind regards,

Tony Waiguru
